Lead-Based Paint

For some road construction projects, the Colorado Department of Transportation (CDOT) needs to acquire private property for use as highway right-of-way. In some cases, the property may contain lead-based paint, a product that was banned in the U.S. in 1977 to reduce the risk of lead poisoning, especially by children who ingest paint peelings or chips. Lead paint also is found on old highway structures, especially bridges.

Prior to undertaking a highway improvement project, CDOT examines any structures that will be disturbed and any property to be acquired to determine whether or not lead paint is present. If it is determined that lead paint will be encountered, any disturbance, removal and disposal of contaminated materials is performed in accordance with established safety procedures.
