Environmental Tradeoffs

Meeting transportation needs often involves consideration of alternatives (technologies, locations, design details) that would have different environmental impacts. Selecting the preferred alternative often involves making tradeoffs.

For example, is it more important to avoid impacts to a residence or a business -- a farm or a community park? The answers to these questions depend on input from the agencies, communities and individuals that would be affected by the decision. Public and agency input is an important part of the decision-making process.

Under federal law, some types of resources have more regulatory protection than others. Examples of highly protected resources include wetlands, historic sites, and the habitat of endangered species.
