Herbicide Use for Noxious Weed Control

Herbicides are one of the methods used by the Colorado Department of Transportation (CDOT) to control the spread of noxious weeds along State Highway corridors. Herbicides are chemicals that destroy or inhibit the growth of certain plants, especially weeds. If not applied properly, herbicides have the potential to damage non-targeted plants, and to otherwise cause harm to humans and ecosystems.

Herbicide use along CDOT highways is allowed only by Certified Operators who are licensed by the Colorado Department of Agriculture, or by other persons in the presence of a Qualified Supervisor. To obtain certification, these specialists must demonstrate detailed knowledge of proper use, herbicide regulations, safety precautions, public safety precautions, and environmental protection.
