Yellow Nutsedge

(Cyperus esculentus)

The Colorado Noxious Weed Act requires every landowner to **eradicate, contain or suppress this weed** wherever it is found on his or her property. The Colorado Department of Transportation controls these weeds on its right-of-way.

Yellow nutsedge is a perennial, grass-like species that grows 6 to 30 inches tall. It is particularly noticeable in July and August when it grows more quickly than native species and stands out (visually) above the rest. The seeds are yellowish, triangular, and oblong. Flowers are yellowish-brown.

The key to controlling yellow nutsedge is not allowing the plant to form its tubers. Hand pulling plants when they first appear helps deplete the nutrients needed for tuber growth. More details about this species and controlling it are available online at <http://www.colorado.gov/ag/weeds>.
