

EVERYBODY BUCKLED UP ACCORDING TO HIS OR HER AGE.

Did you know the back seat is the safest place for tweens?

- **Bones are still developing in children under 13.** If a seat belt doesn't properly fit your child's body, it probably won't protect him or her in a crash.
- **Airbags are a risk.** In the event of a crash, vehicle airbags can kill a child sitting improperly in the front seat.
- **Seat belts must be positioned correctly.** A booster can help position the seat belt correctly on a child's body and protect him or her in a crash.
